

Experts weigh in on SRM

Some results from recent survey of researchers by the New Scientist magazine:

Do you anticipate countries or private groups will attempt to deploy large scale solar radiation modification (SRM) this century?

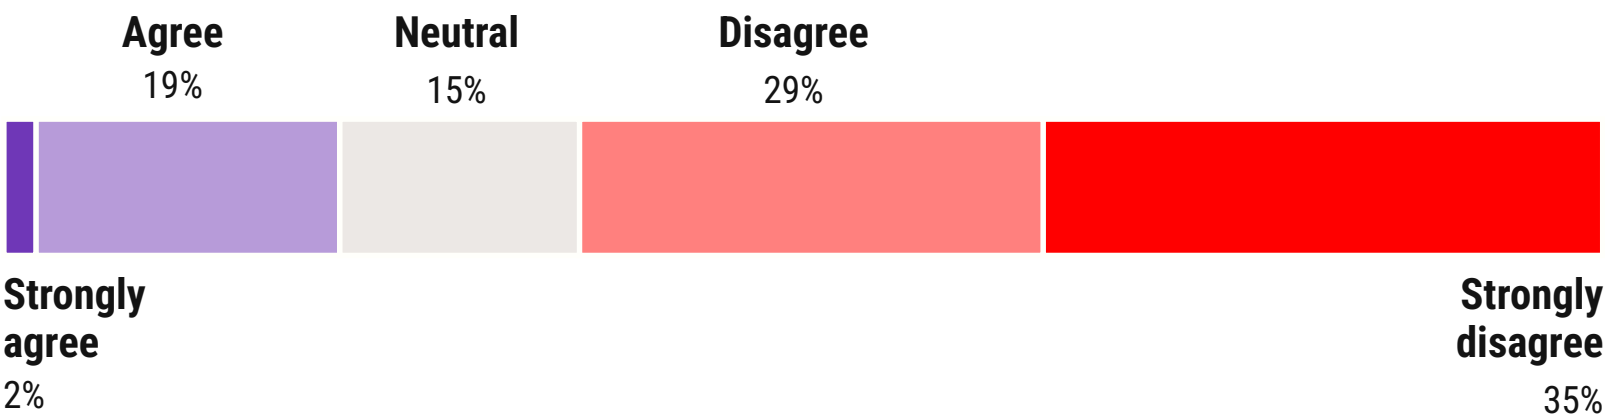

Does the world need a new international treaty or convention to govern potential deployment of SRM?

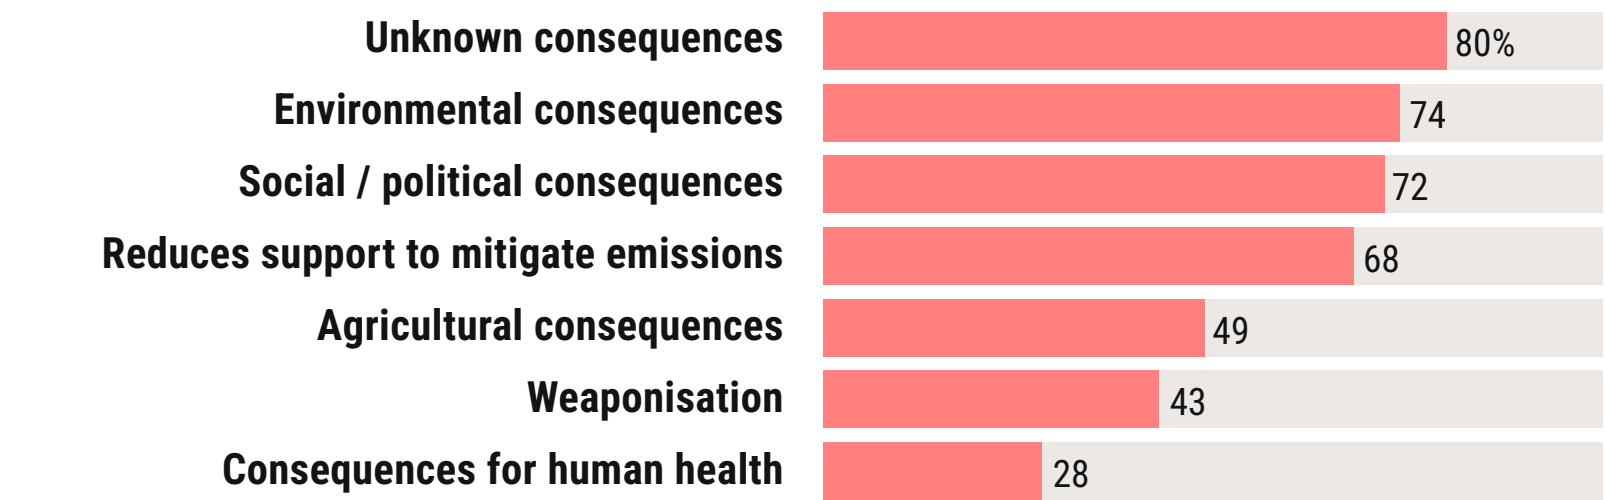

Do you agree or disagree with this statement?

“We should consider deploying SRM if the world’s emissions trajectory means we are certain to breach the 2°C global average warming target under the Paris Agreement.”

Which of these represent the most serious risks* of solar geoengineering in your view?

*Multiple responses allowed.
Source: New Scientist magazine invited nearly 800 researchers to participate in an anonymous online survey about SRM research. All of those polled have contributed to the most recent Intergovernmental Panel on Climate Change (IPCC) Assessment Report. A total of 120 researchers responded.
